REPEATABLE RESULTS, AUTOMATED

Distillation

STRAIN SPECIFIC COMPOSITE DISTILLATES

Organnx is taking an approach to existing, known extraction and distillation processes and creating adaptations that can impact specific markets within the cannabis industry. Organnx has new distillation technology that is employed not only to satisfy commercial crude oil distillation contracts but is providing the basis for a new concentrate product classification that is described as "Strain Specific Composite Distillates". Organnx strain specific composite distillates are marketed under the **Formula™** brand.

Currently, "strain specific" is a hot topic when discussing terpene packages, cannabinoids, and THC/CBD ratios within distillate products as well as the resulting entourage effects of these combinations. These themes are gaining momentum from the experienced user community and also from the marketing efforts of quality distillate product retailers. Existing processes focus on the quality of the specific input strain and the efforts to maintain the strain through the various extraction and distillation processes.

Organnx' new process does not focus on what is going into the front end of the extraction and distillation systems. Instead, Organnx uses new distillation technology to create a strain specific concentrate

based on known strain fingerprint profiles after separation into base components has been completed. Organnx' **Formula™** composites standardize the expected product effects time after time due to the high level of ingredient quality and exact, repeatable fingerprint based recipes. Organnx is able

to produce **Formula™** strain specific composite distillates in market quantities using customer specified strain fingerprint recipes. Contact us to discuss **Formula™** and how to move forward with the implementation of this product technology into your organizations market offerings.

HERE - WE'RE TRYING TO
ACCOMPLISH SOMETHING.

THOMAS ALVA EDISON

Facilities

CANNABIS OIL PROCESSING

Organnx is a process engineering-based company strategically moving forward with the formation of cannabis oil extraction and distillation facilities in all legal cannabis state markets. We are a technology-oriented company that has proprietary automated processing equipment and that has relevance in both recreational and medical cannabis products and delivery systems. Organnx' primary goal is to provide crude oil, distillates and isolated cannabinoids at volumes and prices that meet customer demands and delivery specifications. Organnx' volume pricing agreements are targeted to eliminate the need for

customers owning and operating unique single company scale extractions and distillation systems to meet operational product requirements.

GENERATION 2

Organnx generation 2 extraction and distillation systems are fully automated for complete control of process output. Delivered products are processed to meet strict specifications and contracted on weekly or monthly product volumes. Product delivery specifications are necessary to ensure that all oils and distillates meet standards required for downstream manufacturing repeatability

and quality control. The base oil production of the extraction system can be tuned to focus on volume production for recreational products/strains or purity for medically focused production targets. The fully automated distillation system is designed to process, isolate and purify the individual cannabinoids in the extracted oil through multiple stages of close path distillation through a new proprietary Organnx technology. Organnx is currently executing contracts for weekly and monthly extraction and distillation as well as contracts for winterized crude oil distillation.

Contact Us

CANNABIS PROCESSING FACILITY HOLLISTER, CA

Weekly and monthly contracts for cannabis concentrate extraction and distillation are available as well as contracts for winterized crude oil distillation. All contracts are written with customer product delivery specifications included.

Contracts for cannabis extraction and distillation are being set at \$100 per pound* for customer supplied trim & flower.

Contracts for customer provided winterized crude oil are being set at \$1 per gram* for distillation.
